In addition, in claim 3, a pair of right recesses define in a lower surface and a folding resistant strength of the element body is uniform laterally and the position of the recess is determined in the vicinity of the point of intersection of the lines (S1 and S2) such that the lower edge of the element body is defined by the first line inside the recess and by the second line outside the recess and the line S1 is defined by  $Y=Y_r \bullet \sqrt{[(L-X)/L]}$ , where Y is the vertical

distance from S1 to the saddle to the saddle, at a given coordinate X from a reference point and Yr representing the vertical distance at the lateral point. In addition, in claim 4 each recess is positioned in the vicinity of a point of intersection of a straight line from a fulcrum for a total sum of moments applied to the saddle surface in parallel to the V-face of the first line S1.
